Authorization

The token returned from a successful authentication request is used in the header of each subsequent request for authorization.

Header key: Authorization
Header value: Token token_string

In cURL:

```
curl -H "Authorization: Token token_string" --request GET
http://api/url/here/
```

In Postman:

We need to select "No Auth" in the "Authorization" tab and instead use a custom header because Postman's default value for the Authorization header is "Bearer token_string".
